

The history of Cordys goes back to 1978 when Cordys founder and CEO Jan Baan developed a rudimentary financial model, which enabled him to simulate projected annual financial statements. In addition to his consulting work in the area of financial engineering, he started to develop business administration software for a new computer system called Durango. Very soon the Unix based software became hardware and software independent. The first steps towards an ERP system had been taken.

It's Cordys' mission to improve customers' business operations with world-class, process oriented software which allows organizations to change and innovate the way they do business with greater speed and flexibility.
